WHERE IS THE CODE?

Assignment Project Exam Help

https://tutorcs.com

WeChat: cstutorcs

Live lecture code can be found here:

HTTPS://CGI.CSE.UNSW.EDU.AU/~CS1511/23T1/LIVE/WEEK08/

WHY?

- Linked lists are dynamically sized, that means we can grow and shrink them as needed - efficient for memory!
- Elements of a linked list (called nodes) do NOT need to be stored contiguously in memory, like an array.
- https:/theolistcowithout worrying about size (unless we run

 WeChautraftmemory of course!)
 - We can change the order in a linked list, by just changing where the next pointer is pointing to!
 - Unlike arrays, linked lists are not random access data structures! You can only access items sequentially, starting from the beginning of the list.

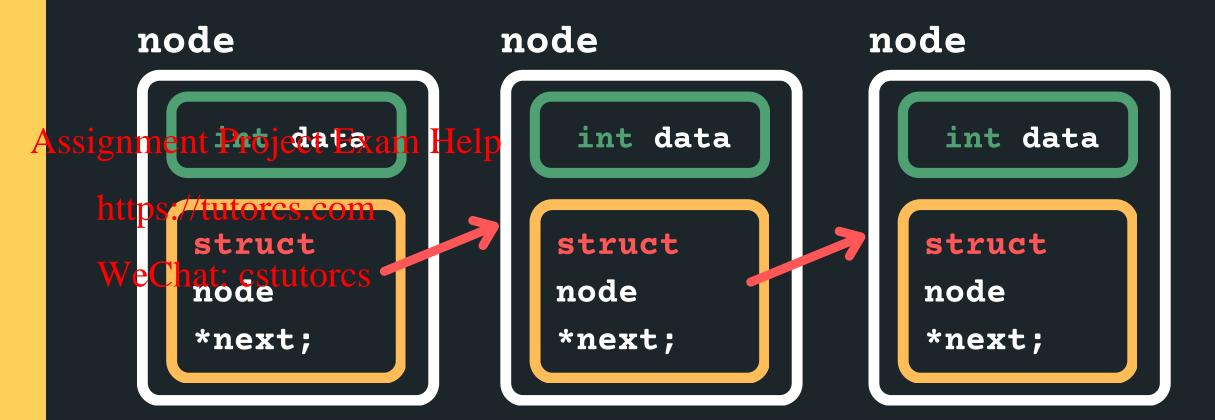

WHAT IS A NODE?

- Each node has some data and a pointer to the next node (of the same data type), creating a linked structure that forms the list
- Let me propose a node structure like this:

```
struct node {
ssignment Project Exam Heint data;
                   struct node *next;
     hat: cstutorcs
    node
                          some data of type int
        int data
                           a pointer to the next node,
       struct
                           which also has some data
       node
                           and a pointer to the node
       *next;
                           after that... etc
```

THE NODES ARE
LINKED TOGETHER (A
SCAVENGER HUNT
OF POINTERS)

 We can create a linked list, by having many nodes together, with each struct node next pointer giving us the address of the node that follows it

But how do I know where the linked list starts?

THE NODES ARE
LINKED TOGETHER (A
SCAVENGER HUNT
OF POINTERS)

What about a pointer to the first node?

A pointer to the first node (not a node itself, but has the memory address of where the first node is!

How do I know when my list is finished?

A pointer

first node

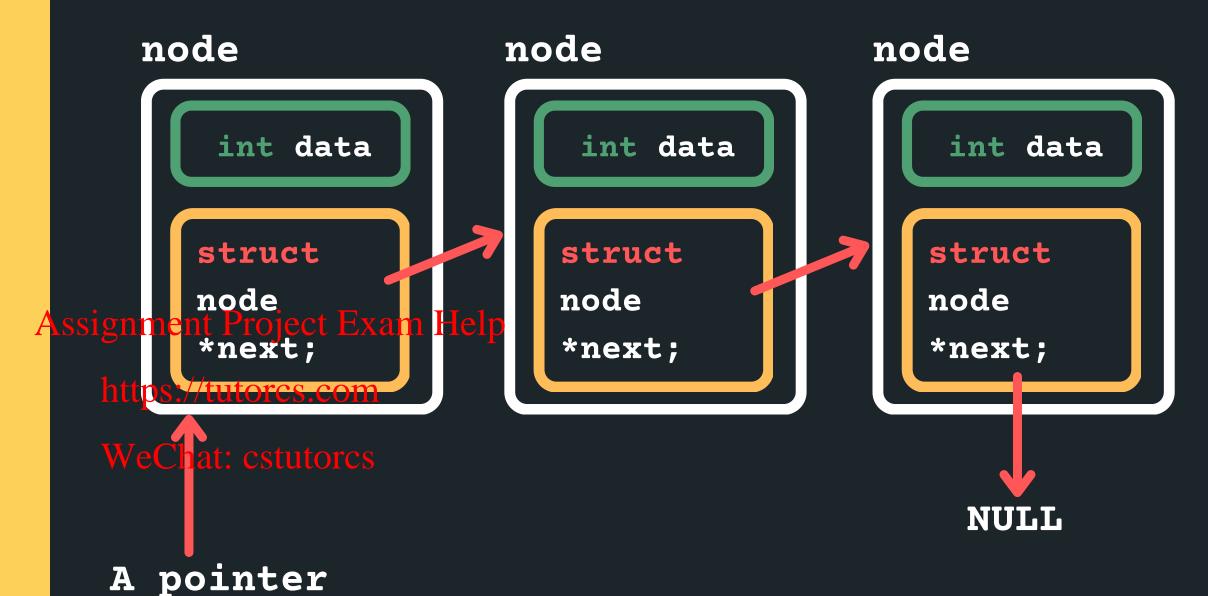

to the

THE NODES ARE
LINKED TOGETHER (A
SCAVENGER HUNT
OF POINTERS)

Pointing to a NULL at the end!

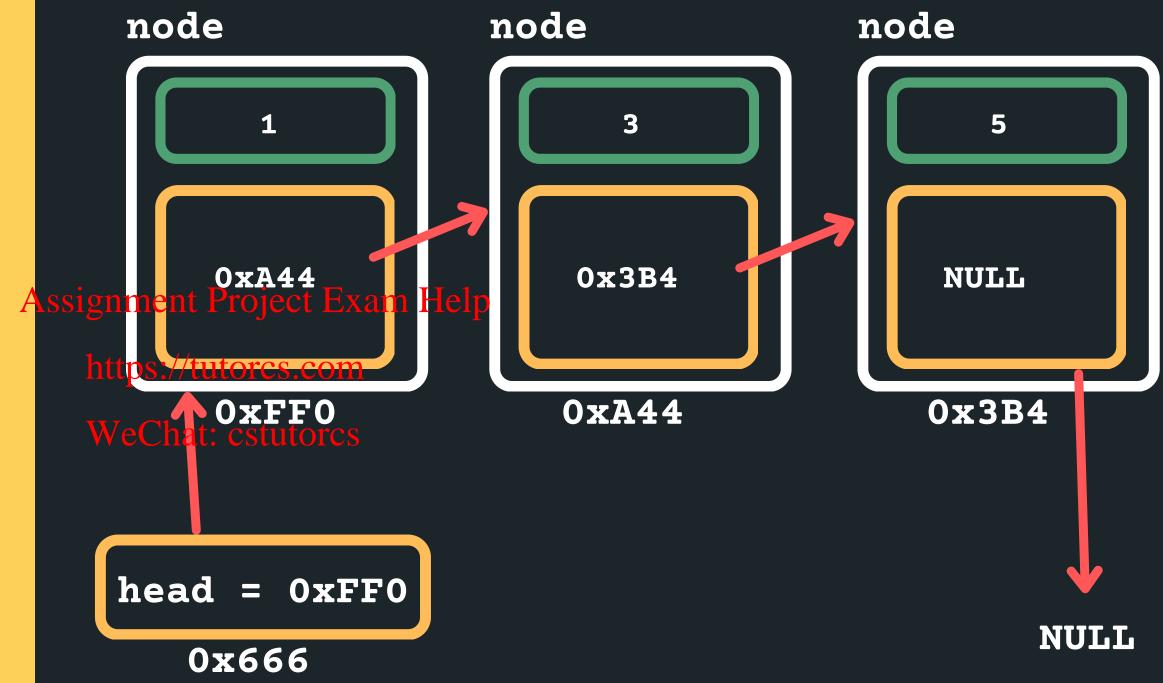

to the

first node

THE NODES ARE
LINKED TOGETHER (A
SCAVENGER HUNT
OF POINTERS)

• For example, a list with: 1, 3, 5

HOW DO WE CREATE ONE AND INSERT INTO IT?

- In order to create a linked list, we would need to
 - Define struct for a node,
 - A pointer to keep track of where the start of the list is and
 - A way to create a node and then connect it into

Assignment Project Hsam Help

https://tutorcs.com

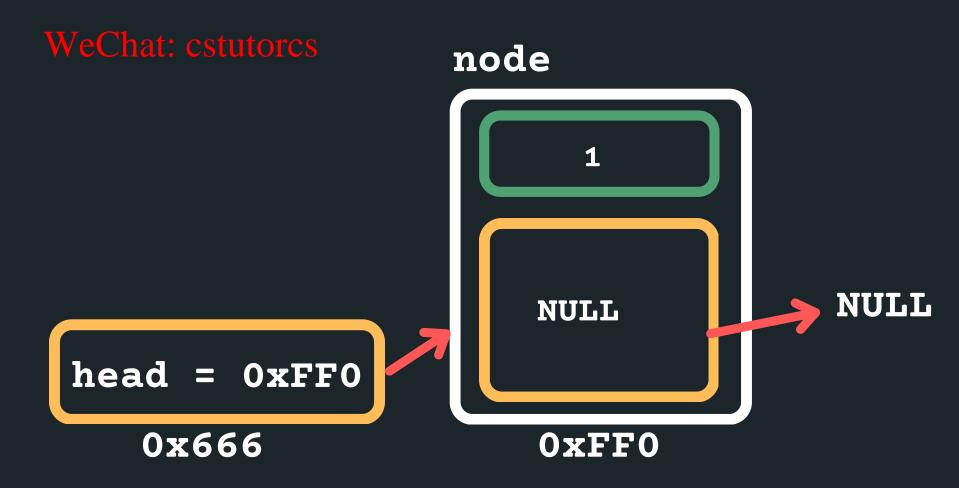

WeChat: cstutorcs

HOW DO WE CREATE ONE AND INSERT INTO IT?

- Let's say we wanted to create a linked list with 5, 3, 1
 - Let's create the first node to start the list!
 - A pointer to keep track of where the start of the list is and by default the first node of the list
 - It will point to NULL as there are no other nodes

Assignment Project Misans Help

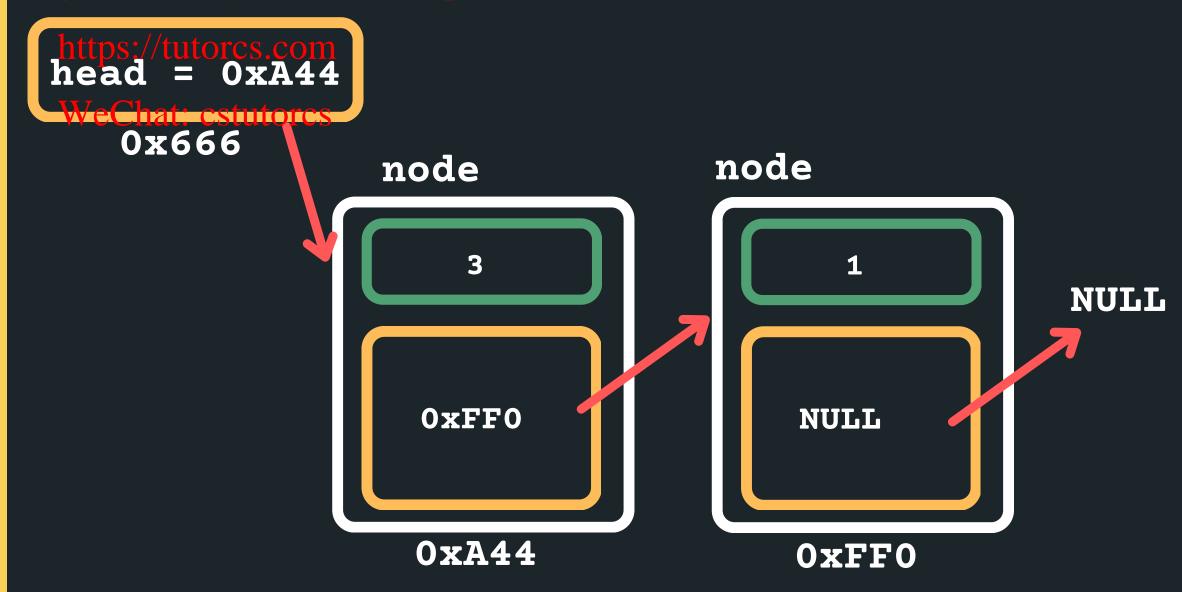

https://tutorcs.com

HOW DO WE CREATE ONE AND INSERT INTO IT?

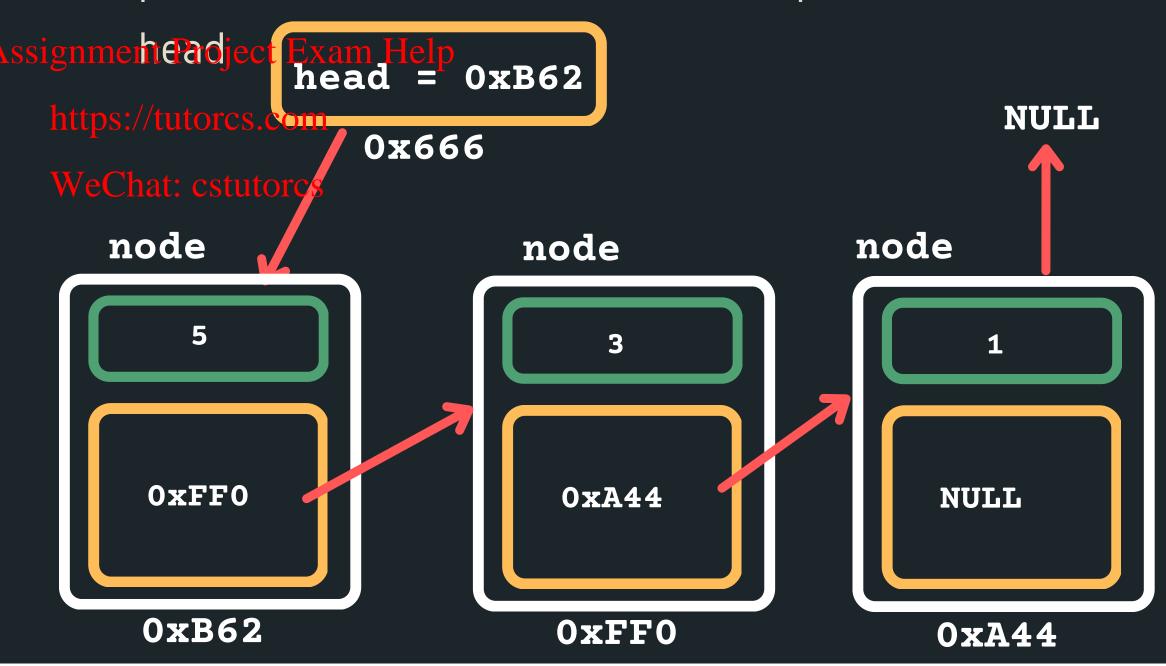

- Create the next node to store 3 into (you need memory)
- Assign 3 to data
- and insert it at the beginning so the head would now point to it and the new node would point to the old

Assignment@oject Exam Help

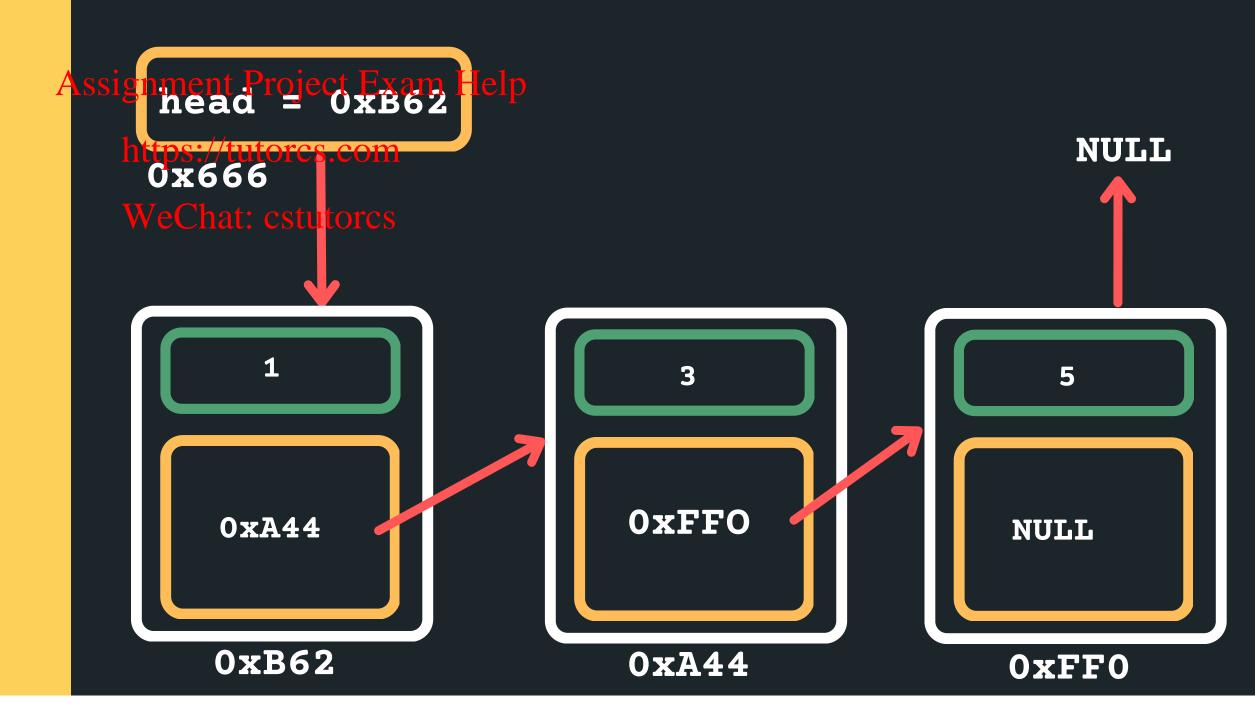

HOW DO WE CREATE ONE AND INSERT INTO IT?

- Create the next node to store 5 into (you need memory)
- Assign 5 to data
- and insert it at the beginning so the head would now point to it and the new node would point to the old

INSERTING

- Where can I insert in a linked list?
 - At the head
 - Between any two nodes that exist
 - After the tail as the last node

PUTTING IT ALL TOGETHER IN CODE

- 1. Define our struct for a node
- 2. A pointer to keep track of where the start of the list is:
 - The pointer would be of type struct node, because it is pointing to the first node
- ssignment ProJohe Hirst Mode of the list is often called the 'head'

 https://tutorof.the list (last element is often called the 'tail')

 Wegh Atway toccreate a node and then connect it into our

 list...
 - Create a node by first creating some space for that node (malloc)
 - Initialise the data component on the node
 - Initialise where the node is pointing to
 - 4. Make sure last node is pointing to NULL

SO TRAVERSING A LINKED LIST...

- The only way we can make our way through the linked list is like a scavenger hunt, we have to follow the links from node to node (sequentially! we can't skip nodes)
- We have to know where to start, so we need to know Assignmenther dieactorinther list

https:///whenswerreach the NULL pointer, it means we have WeChabroseutordshe end of the list.

INSERTING

- You should always consider and make sure your solution works:
 - Inserting into an empty list
 - Inserting at the head of the list
 - Inserting after the first node if there is only one

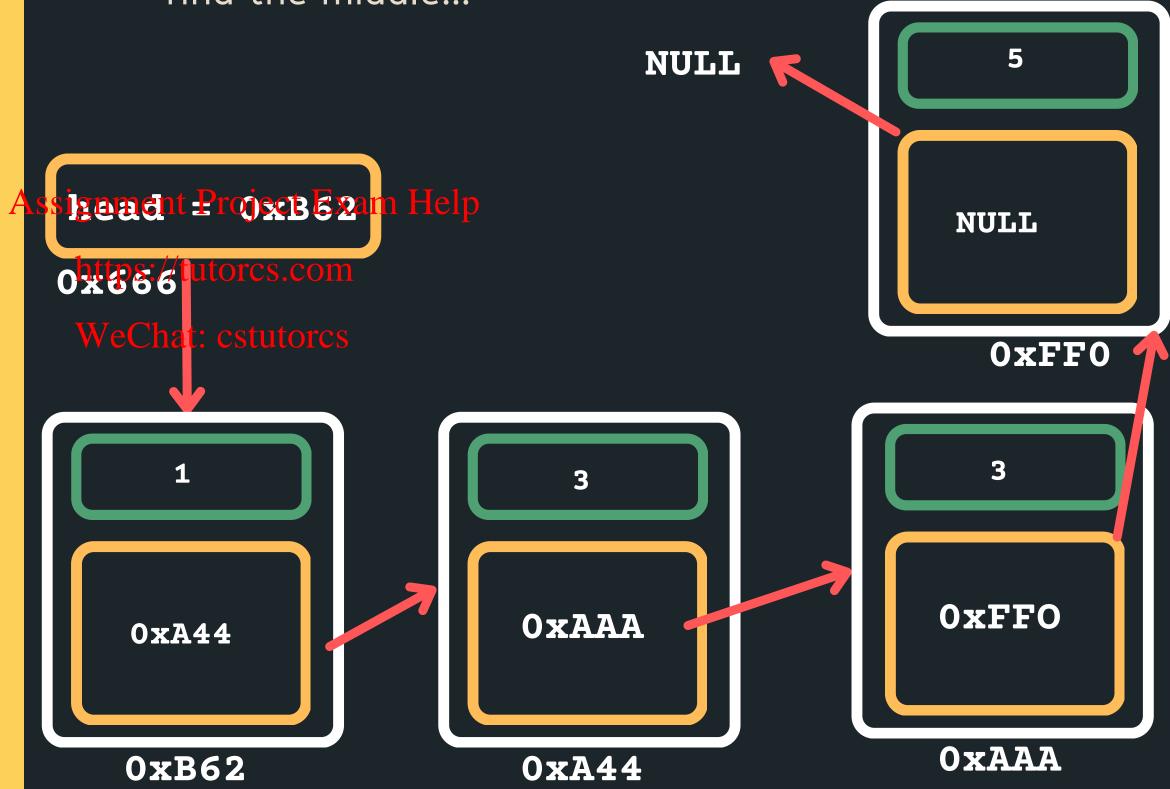

Assignment PropadExam Help

https://tutorcs.com

West Drawwodiagram!!!! It will allow you to easily see what are some potential pitfalls

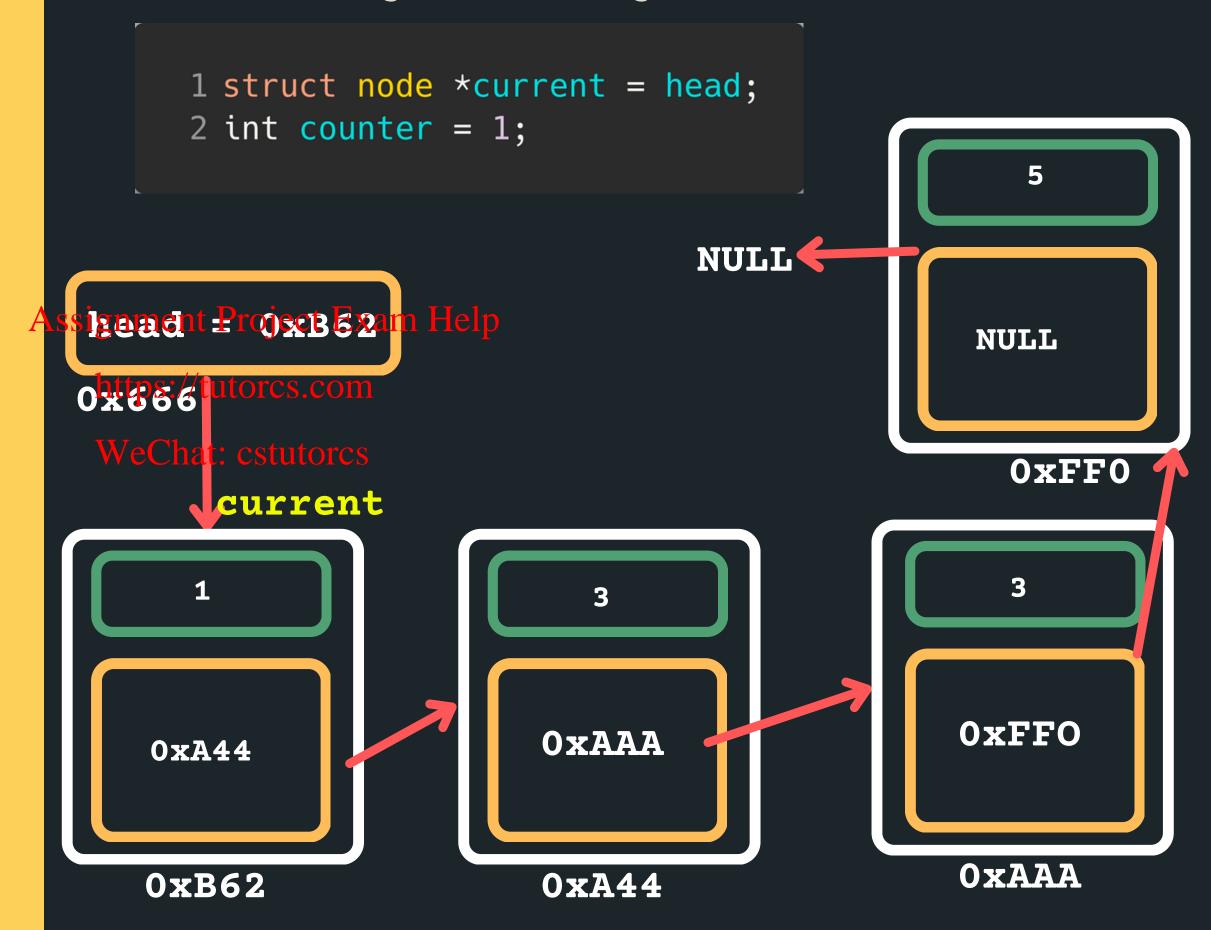

INSERT IN THE MIDDLE

• Let's consider an easy case to insert in the middle, find the size of the list and then divide that by 2 to find the middle...

INSERT IN THE MIDDLE

Move through the list to get to the second node

INSERT IN THE MIDDLE

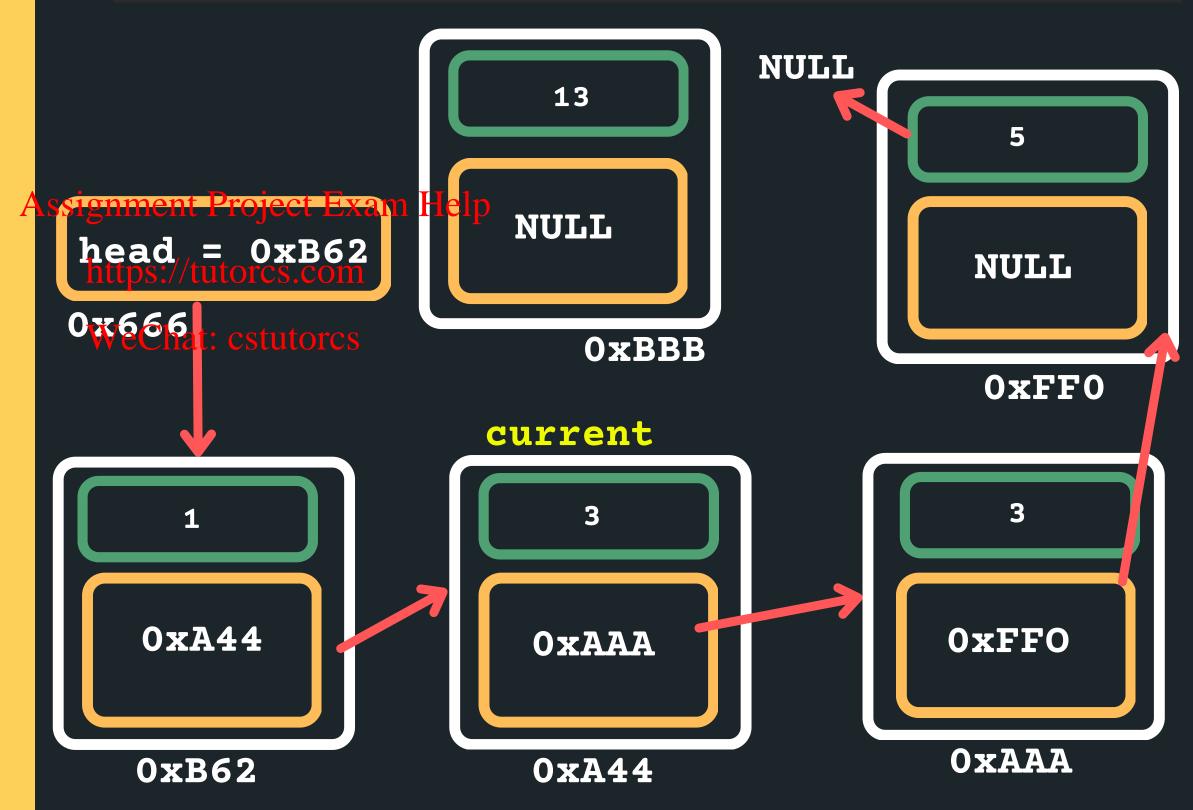

Move through the list to get to the second node

```
1 while (counter != size_linked_list/2) {
          current = current->next;
     3 }
                                                     5
                                  NULL
signment Project Exam Help
                                                  NULL
0x566
       utorcs.com
 WeChat: cstutorcs
                                                    0xFF0
                       current
                            3
                                                 0xFF0
                         OxAAA
   0xA44
                                                 OxAAA
   0xB62
                         0xA44
```

INSERT IN THE MIDDLE

Make a new node to insert

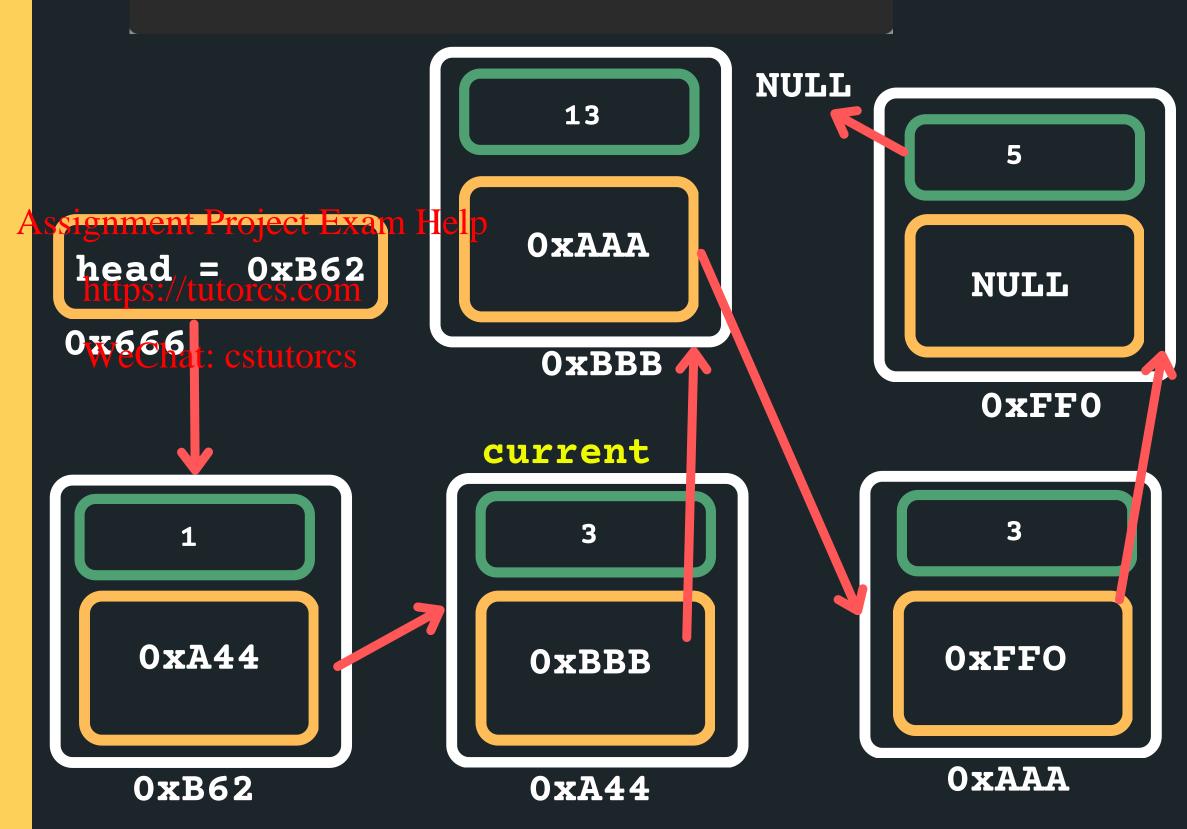

```
1 struct node *new_node = malloc(sizeof(struct node));
2 new_node->data = 13 //Example data!
3 new_node->next = NULL;
```

INSERT IN THE MIDDLE

Connect the node in between the two nodes

```
1 new_node->next = current->next;
2 current->next = new_node;
```

LET'S INSERT IN THE MIDDLE?

- Great!
- Let't think of some conditions that may break this ...
 - What happens if it is an empty list?
 - What happens if there is only one item in the list?
- How can we safeguard?

Assignment Project Exam Help

https://tutorcs.com

WeChat: cstutorcs

INSERT AFTER A PARTICULAR NODE?

- What about inserting in order into an ordered list?
 Let's try that as a problem and then walk through the code...
- So for example, I have a list with 1, 3, 5 and I wanted to insert a 4 into this list - it would go after 3 ...

https://tutorcs.com

WeChat: cstutorcs

INSERTING A NODE

- In all instances, we follow a similar structure of what to do when inserting a node. Please draw a diagram for yourself to really understand what you are inserting and the logic of inserting in a particular way.
- To insert a node in a linked list:
- https://tutorthe.node after which you want to insert the node (stop at wechat: esMalloc a new node for yourself
 - Point the new_node->next to the current->next
 - Change the current->next to point to the new node
 - Consider possible edge cases, empty list, inserting at the head with only one item, etc etc.

BREAK TIME

Assignment Project Exam Help

https://tutorcs.com

WeChat: cstutorcs

Can you determine how many times do the minute and hour hands of a clock overlap in a day?

DELETING

- Where can I delete in a linked list?
 - Nowhere (if it is an empty list edge case!)
 - At the head (deleting the head of the list)
 - Between any two nodes that exist
 - At the tail (last node of the list)

Assignment Project Exam Help

https://tutorcs.com

WeChat: cstutorcs

DELETING EMPTY LIST

- Deleting when nowhere! (it is an empty list)
 - Check if list is empty
 - If it is return NULL

```
struct node *current = head;
if (current == NULL){
Assignment Figure and Figure and
```

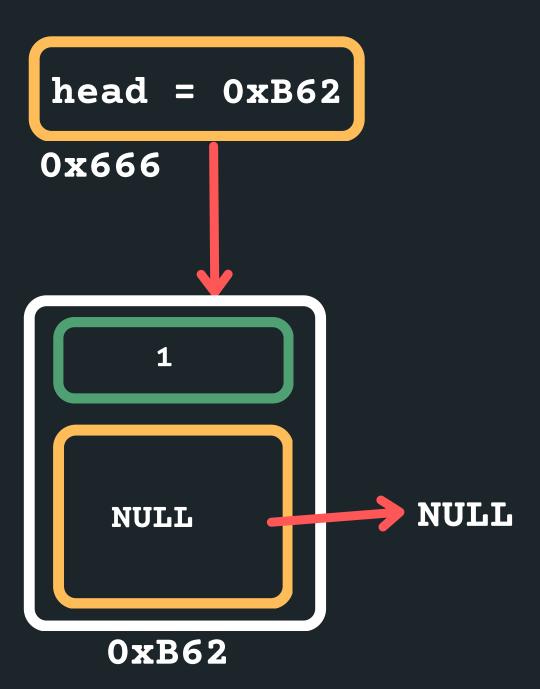

DELETING ONE ITEM

Deleting when there is only one item in the list

current->next = new_next;

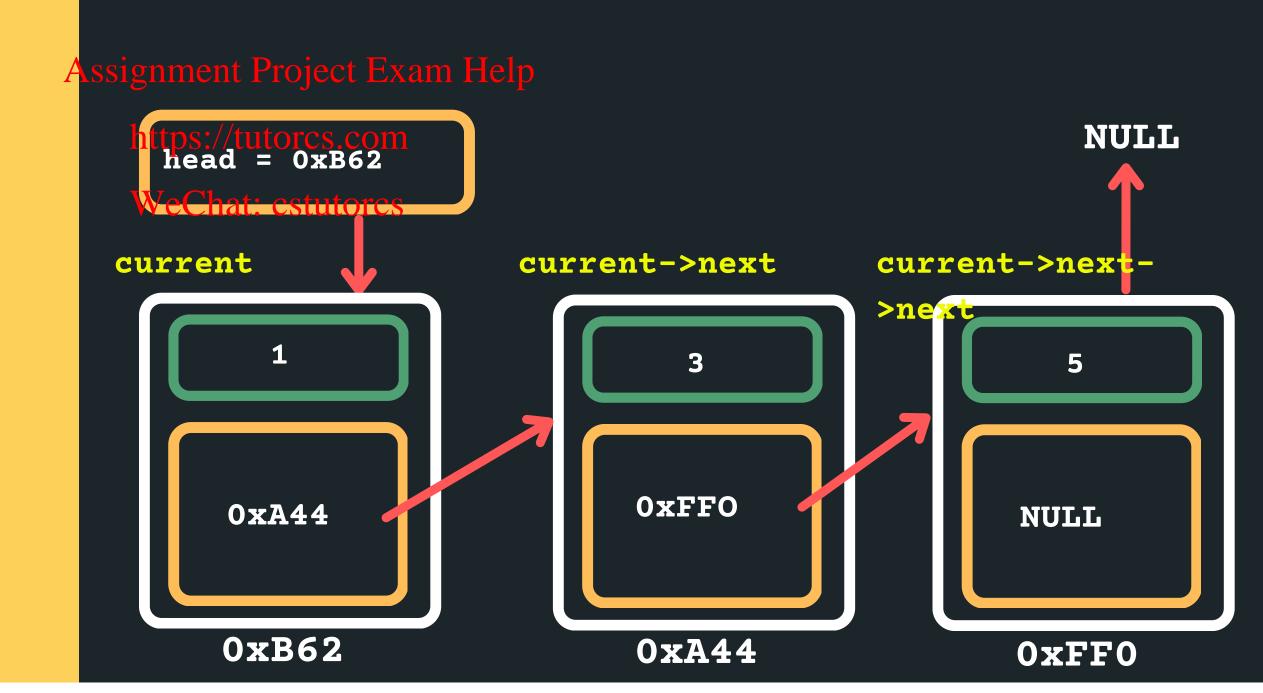

Assignment Project Exam Help

DELETING THE TAIL

- Deleting when in the tail
 - Set the current pointer to the head of the list

struct node *current = head

DELETING THE TAIL

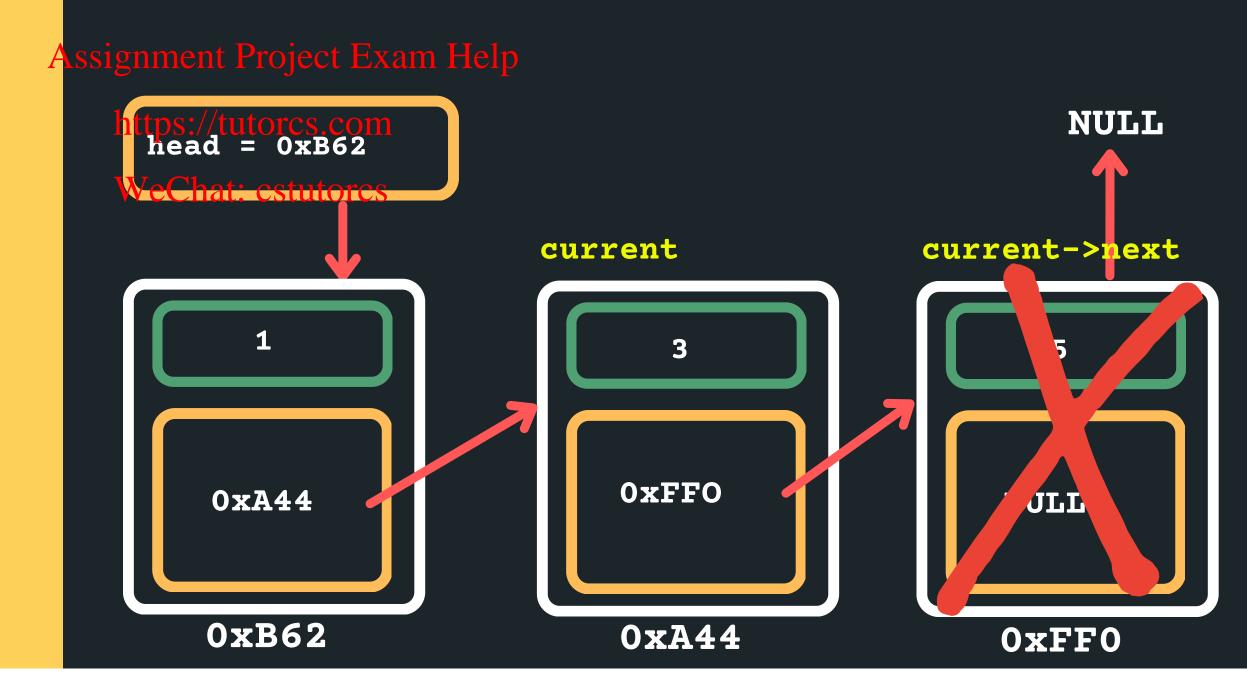

- Deleting when in the tail
 - Find the tail of the list (should I stop on the tail or before the tail?)
 - If the next is NULL than I am at the tail...

```
while (current->next->next != NULL){
    current = current->next;
nment Project Exam Help
                                             NULL
head = 0xB62
                   current
                                      current->next
                       0xFF0
   0xA44
                                          NULL
   0xB62
                       OxA44
                                          0xFF0
```

DELETING THE TAIL

- Deleting when in the tail
 - Delete the current->next node

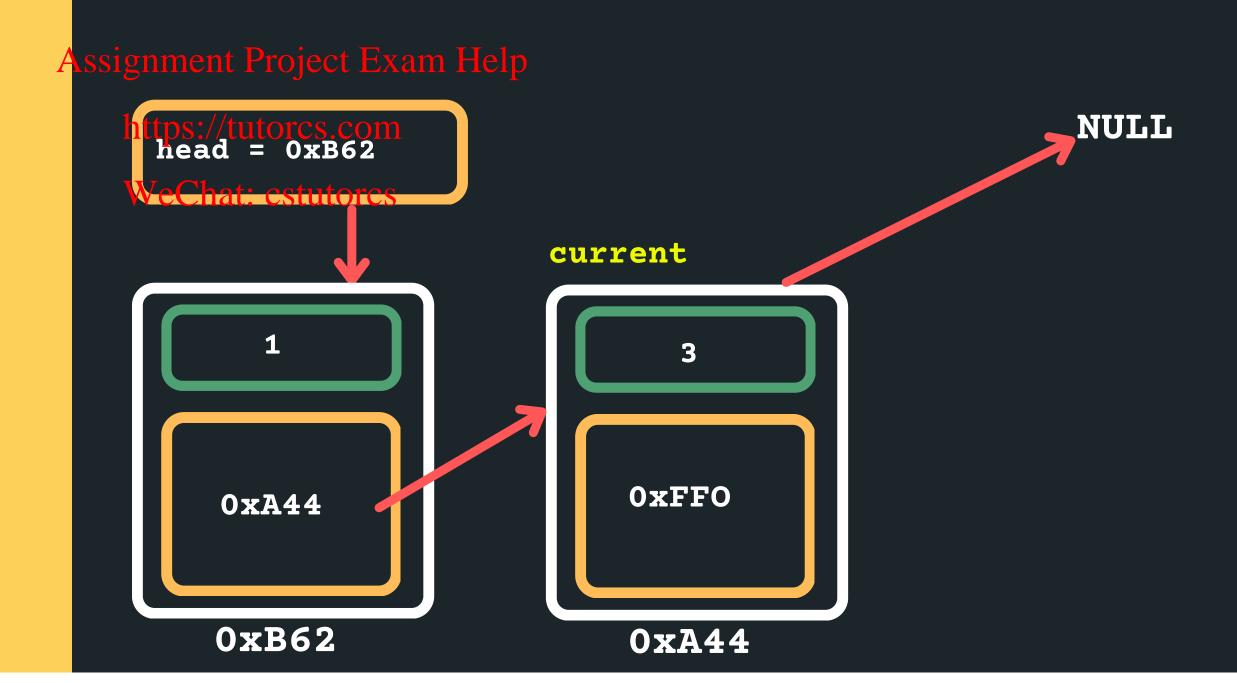

free(current->next);

DELETING THE TAIL

- Deleting when in the tail
 - Point my current->next node to a NULL

current->next = NULL;

DELETING A NODE

- In all instances, we follow a similar structure of what to do when deleting a node. Please draw a diagram for yourself to really understand what you are deleting and the logic of deleting in a particular way.
- To delete a node in a linked list:

Assignment Profine the previous node to the one that is being https://tutordeleted

WeChat: % Change the next of the previous node

- Free the node that is to be deleted
- Consider possible edge cases, deleting if there is nothing in the list, deleting when there is only one item in the list, deleting the head of the list, deleting the tail of the list, etc.

DELETING A NODE

```
1 struct node *delete_node (struct node *head, int data) {
       // Create a current pointer set to the head of the list
       struct node *current = head;
      // Sometimes it is helpful to keep track of a previous node
       // to the current as that means you won't lose it....
       struct node *previous = NULL; // If the current node is at head, that
                                     // means the previous node is at NULL
 8
       // What happens if we have an empty list?
       if (current == NULL) {
10
           return NULL;
11
12
       } else if (current->data == data) {
13
      // What happens if we need to delete the item that is
14
       // the head of the list?
15
           struct node *new_head = current->next;
16
           free(current);
    Drojo neturn new head;
          // This will return whatever was after current as the
           // new head. If there is only one node in the list and
20
   Utores.Com is the one to be deleted, it will capture this (NULL)
21
      /// Otherwise start looping through the list to find the data
23
       // 1. Find the previous node to the one you want to delete
24
25
       while (previous->next->data != data && current->next != NULL) {
26
           previous = current;
27
           current = current->next;
28
29
30
       // 2. If the current node is the one to be deleted
31
       if (previous->next->data == data) {
32
           //point the next node to the new pointer
33
           previous->next = current next;
           // 3. free the node to be deleted
34
35
           free(current);
36
37
38
       return head;
39 }
```
